

OverOps + New Relic®

Get more value from your APM

Dive deeper than ever before to get the True Root Cause of performance degradation and slowdowns directly within your New Relic instance.

Code-Level Insight is One Click Away

OverOps analyzes application code at runtime to enhance log data at the moment of an event. With the OverOps and New Relic integration, links are inserted directly into your log files so that deep, code-level context can be surfaced and accessed while troubleshooting with just one click.

 Capture a snapshot of the **complete state of your code** from the moment a slowdown or logged error is captured in New Relic.

 Get the **source code, variables, DEBUG logs and environment state** for 100% of bottlenecks and exceptions – even uncaught.

 Break down walls between Dev and Ops by **routing issues to the right developer** with the context needed to reproduce and resolve.
